NAME:

Date of Birth:

02-02-2003 (month-date-year)

My patient mentioned above is suffering from Diabetes Mellitus (Type I) and needs regular treatment with insulin.

Therefore my patient needs to have permission to have insulin within the handluggage at all times, and needs to have permanent access to the insulin.

In case my patient needs to measure blood glucose levels, which is necessary in case my patient doesn't feel well or before a meal, use of the glucose measurement device should be permitted.

In case of low blood glucose levels (hypoglycaemia, which is a medical urgency) a glucose-containing beverage should be available at all times.

NAME OF THE INSULIN USED:

Tresiba

insuline aspart

NAME OF THE INSULIN Pump.

Both, the insulin pump and sensor, can not pass through scanning equipment, this could lead to malfunction or even damage the insulin pump or sensor.

sensor Libre

NAME OF GLUCOSE MEASUREMENT DEVICE :

libre

OTHER REQUIREMENTS/NECESSITIES:

OTHER MEDICINE;

baqsimi/ ondansetron

I assume this information will be sufficient to allow my patient to take insulin on the flight or any other trip.

Yours sincerely,
